

IN THE CLAIMS

Please amend the claims as follows:

Claim 1 (Currently Amended): An information processing device, comprising:

transmitting means for transmitting user registration data necessary to secure a user's exclusive storage area by user registration in a server connected in a network for content distribution, to said server over a network;

receiving means for receiving address data defined, in part, by the user registration data, the address designated as an access point indicating said exclusive storage area over said network and for receiving one or more automatic upload programs each of said automatic upload programs being programmed to connect to a unique part of said exclusive storage area and to provide an interface for editing condition data to manage distribution of an associated content file;

connection means for allowing each of said automatic upload programs to perform connection processing automatically to said access point in the said server via actuation of a corresponding upload icon; and

transfer means for writing the content file to be distributed to the exclusive storage area automatically when connection processing is performed and for transferring the associated control file controlling distribution of the transferred content file from the server, the control file including the condition data set up through the interface and user information data related to the user registration,

wherein a genre of the content file, a codec used to encode and/or decode the content file, a schedule specifying when associated with the distribution of the content file is broadcast from the server over the network, a commercial setting associated with the content

file and a content identification corresponding to the content file are included in the associated control file and are edited via the interface and transmitted to the server.

Claims 2-3 (Canceled).

Claim 4 (Previously Presented): The information processing device according to Claim 1, wherein

 said connection means is to perform connection processing to said access point in said server in response to a click operation on an exclusive icon which is displayed on a given display unit for driving said automatic upload program.

Claim 5 (Original): The information processing device according to Claim 1, wherein
 said address data is a uniform resource locator (URL) for designating resources on
 said network.

Claim 6 (Currently Amended): A server connection method, comprising:
 transmitting user registration data necessary to secure a user's exclusive storage area
 by user registration in a server connected in a network for content distribution, to said server
 over the network;

 receiving address data defined, in part, by the user registration data, the address
 designated as an access point indicating said exclusive storage area from said server over said
 network;

 receiving an automatic upload program;

performing connection processing automatically to said access point in the said server via actuation of a corresponding upload icon of the automatic upload program based on said address data received by said receiving means;

providing an interface for editing condition data to manage distribution of an associated content file;

writing a data file to the exclusive storage area automatically when connection processing is performed to be distributed;

transferring the associated control file controlling distribution of the transferred data file from the server, the control file including the condition data and user information data related to the user registration data related to the user registration;

updating a genre of the content file, a codec used to encode and/or decode the content file, a schedule specifying when associated with the distribution of the content file is broadcast from the server over the network, a commercial setting associated with the content file and a content identification corresponding to the content file of the condition data via the interface; and

updating the server with the updates of the condition data made via the interface.

Claims 7-8 (Canceled).

Claim 9 (Previously Presented): The server connection method according to Claim 6, wherein

said connection step is to perform connection processing to said access point in said server responding to a click operation on an exclusive icon which is displayed on a given display unit for driving said automatic upload program.

Claim 10 (Original): The server connection method according to Claim 6, wherein said address data is a uniform resource locator (URL) for designating resources over said network.

Claim 11 (Currently Amended): A program storage medium adapted to store computer program instructions which cause a computer to implement a method of information processing, the method comprising:

transmitting user registration data necessary to secure a user's exclusive storage area by user registration in a server connected in a network for content distribution, to said server over the network;

receiving address data defined, in part, by the user registration data, the address designated as an access point indicating said exclusive storage area from said server over said network and of receiving one or more automatic upload programs, wherein each of said automatic upload programs being programmed to connect to a unique part of said exclusive storage area and to provide an interface for editing condition data to manage distribution of an associated content file;

allowing each of said automatic upload programs to perform connection processing automatically via actuation of a corresponding upload icon to said access point in the said server;

writing a data file to the exclusive storage area automatically when connection processing is performed; and

transferring a control file used for controlling access by another user to the transferred data file, the associated control file controlling distribution of the transferred content file from

the server, the control file including the condition data set up through the interface and user information data related to the user registration;

updating a genre of the content file, a codec used to encode and/or decode the content file, a schedule specifying when associated with the distribution of the content file is broadcast from the server over the network, a commercial setting associated with the content file and a content identification corresponding to the content file of the condition data via the interface; and

updating the server with the updates of the condition data made via the interface.

Claims 12-13 (Canceled).

Claim 14 (Previously Presented): The server connection method according to Claim 11, wherein

said connection step is to perform connection processing to said access point in said server responding to a click operation on an exclusive icon which is displayed on a given display unit for driving said automatic upload program.

Claim 15 (Previously Presented): The program storage medium according to Claim 11, wherein

said address data is a uniform resource locator (URL) for designating resources on said network.

Claim 16 (Currently Amended): A network system consisting of a server and an information processing device to connect to said server over a network, comprising:

transmitting means for transmitting user registration data necessary to secure a user's exclusive storage area by user registration in said server, to said server over said network;

receiving means for receiving address data defined, in part, by the user registration data, the address designated as an access point indicating said exclusive storage area from said server over said network and for receiving one or more automatic upload programs, wherein each of said automatic upload programs being programmed to connect to a unique part of said exclusive storage area and to provide an interface for editing condition data to manage distribution of an associated content file;

connection means for allowing each of said automatic upload programs to perform connection processing automatically via actuation of a corresponding upload icon to said access point in the said server; and

transfer means for writing the content file to be distributed to the exclusive storage area automatically when connection processing is performed and for transferring the associated control file controlling distribution of the transferred content file from the server, the control file including the condition data set up through the interface and user information data related to the user registration,

wherein a genre of the content file, a codec used to encode and/or decode the content file, a schedule specifying when associated with the distribution of the content file is broadcast from the server over the network, a commercial setting associated with the content file and a content identification corresponding to the content file are included in the associated control file and are edited via the interface and transmitted to the server.

Claims 17-18 (Canceled).

Claim 19 (Previously Presented): The network system according to Claim 16, wherein

 said connection means is to perform connection processing to said access point in said server responding to a click operation on an exclusive icon which is displayed on a given display unit for driving said automatic upload program.

Claim 20 (Original): The network system according to Claim 16, wherein
 said address data is a uniform resource locator (URL) for designating resources on
 said network.

Claim 21 (Previously Presented): The network system according to Claim 16,
wherein the data content file is a movie file and the control file comprises at least one of a
time and date for scheduling access to the content file.

Claim 22 (New): The information processing device of Claim 1, wherein the
condition data includes instructions to stream the content file from the server over the
network immediately after receiving the content file from the information processing device.

Claim 23 (New): The information processing device of Claim 1, wherein the
condition data includes information specifying one of a plurality of distribution channels at
the server from which the content file is distributed over the network.
